

Postgres Tables

General

All postgres tables are populated using [/postgresDBtst/postgres-insert-all.py](#).

Logs

If the python file was triggered using the [/postgresDBtst/postgres-insert.bat](#) file, then an output log will be saved in the following dropbox folder: [/systems_data/logs/](#).

Log files will be kept for 7 days and then deleted by the bat file mentioned above.

Backups

If enabled, the input for a table will be also saved as a .csv in a folder with it's table name in the [/systems_data/report_data_source](#) dropbox folder.

The file name of the csv will be a timestamp from when the database was updated with that data.

For example, every time the *late_notice* table is updated, a csv will be created in the folder

[/systems_data/report_data_source/latre_notice/](#)

CMD Args

The python file implements the [argparse](#) package, which means you are able to pass command line arguments to the python program to adjust how it runs.

If no arguments are given, every table will be updated- otherwise the table name(s) can be given as flags to update only those.

Here are a few examples:

- Update all tables: `python postgres-insert-all.py`
- Update just the turnover table: `python postgres-insert-all.py --turnover`
- Update both the property and sites table: `python postgres-insert-all.py --property --sites`

Schedule

The tables are updated using Task Scheduler on the virtual machine [Maserati](#) user the user *jmayberry*.

Here is a list of when each table is updated:

- Daily at 8:00 AM
 - property
 - occupancy
 - sites
 - resident
 - days_vacant
- Every 2 hours between 6:00 AM and 10:00 PM
 - late_notice
- Every 30 minutes between 6:00 AM and 10:00 PM
 - turnover

Unit Tester

The hourly [unit tester](#) program will check the column *date_modified* in each table to make sure they are updating as intended. Because different tables are updated at different rates- different tables need to meet a different threshold requirement to be considered as "updating correctly". If a table is not updating correctly, The MS Teams channel **Unit Tests** will post about it.

Trello Cards

When a table is worked on, it is logged in the following trello cards:

- property: <https://trello.com/c/2vLVAey7>
- turnover: <https://trello.com/c/9q7Y7yFe>
- sites: <https://trello.com/c/rtBoHA79>
- resident: <https://trello.com/c/kTp5ra35>

- occupancy: <https://trello.com/c/pZL0xi2W>
- days_vacant: <https://trello.com/c/5NHHFLy1>
- late_notice: <https://trello.com/c/YIbzHnES>
- acap: <https://trello.com/c/XCiwrpQz>

Data Flows

Here is a visual of how data flows into the postgres tables.

property

turnover

sites

resident

occupancy

days_vacant
